

Global Terrorism Database

Exploratory Analysis

Molly Rovinski, mrovinski@bellarmine.edu

I. Introduction

This data analysis reviews the Global Terrorism Database(GTD) that is collected and maintained by National Consortium for the Study of Terrorism and Responses to Terrorism at the University of Maryland. The GTD documents cases of global terrorism starting from 1970. The dataset can be found at the following site: <https://www.kaggle.com/saadbinmanjuradit/global-terrorism-dataset>. The Codebook for this dataset can be found at the following link: <https://start.umd.edu/gtd/>.

II. Data Set Description

This dataset contains 65,499 events and 125 columns with various data types. The complete list of variables and their types can be found in **Table 1**. Several variables were removed from this dataset prior to beginning the analysis as they were not relevant in this instance. Additionally, every column that was coded for a text column was deleted, as it was duplicate date that had simply been notated in different manners.

III. Data Set Summary Statistics

This section includes a statistics summary for the entire GTD dataset, including count, mean, standard deviation, minimum, quartiles, and maximum, as can be seen in **Table 2**. Following that, a frequency report can be seen for each categorical variable in **Table 3** through **Table 55**. Finally, a correlation table reflecting the relationships between each continuous variable can be found in **Table 56**, with a visual heatmap of the correlation table following in **Figure 1**.

Table 2: Summary Statistics for GTD

IV. Data Set Graphical Exploration

The following section contains graphical explorations of the Global Terrorism Database. These representations include scatter plots, bar charts, distribution plots, line graphs, and box plots.

Throughout the exploration, various variables had to be left out due to abundance of missing data. They will each be explained within their own section.

a. Distributions

Starting with **Figure 2-4** are distribution plots of the GTD's years, months, and days, it can be seen that the dataset is not a normally distributed dataset and that there is a widespread across the months and days that terrorist attacks were most likely to happen. For years, on the other hand, it can be seen that attacks increased in the early 1990's before dropping off. Following with **Figure 3-6**, the distributions of the number of killings, the number of perpetrators, and the number of released hostages can be seen. Unfortunately, most of the data was missing for those three variables, as well as most of the other numerical variables. Additionally, the reason for the negative spread in the number of released hostages is due to the GTD notating unknown fates as -99.

Figure 2-4: Attacks across Time Frames including Year, Month, and Day

Figure 5-7: Number of Killings, Perpetrators, and Released Hostages across the Attacks.

Note: Missing data in the GTD rendered the number of killings, number of perpetrators, and number of released hostages irrelevant.

b. Scatter Plots/Pairwise Plots

Starting with **Figure 8**, the number of killings per attack is plotted against the year in which they happened. Following with **Figure 9**, the number of killings per attack is plotted against the number of perpetrators per attack. As can be seen, most attacks had very few killings or perpetrators that were documented in the GTD. Finally with **Figure 10**, a pairwise plot across all numerical variables, excluding month, day, number of hours for the attack, and various ransom variables. Month and day were removed as it would not make logical sense to plot

those against the rest. The number of hours and the various random variables were removed as they were missing most of their datapoints and caused errors in output patterns.

Figure 8: Number of Killings per Attack by Year

Figure 9: Number of Killings per Attack by Number of Perpetrators per Attack

Figure 10: Pairwise Plot Showing Relationship between Wounded, Killed, Perpetrators, Released, Ransom Amount, and Days of Attack.

Note: Missing data in GTD led to the removal of several ransom variables and the number of hours, as they were causing errors in the output.

c. Bar Charts

The following bar charts all depict the frequency with which certain variables occurred given different parameters. **Figure 11** shows the number of attacks per year in the United States, Iran, El Salvador, and the United Kingdom. They all make historical sense for the time period of 1970-1997, especially seen in the peak of attacks in El Salvador throughout the early 1980s which would have highlighted the start of the Salvadoran Civil War and rise of insurrections. **Figure 12** shows the number of attacks that were seen as a successful attack, notably most of these attacks were successful in some manner. **Figure 13** highlights the primary weapon type used in these terrorist attacks, with explosives and firearms being the most common, as should be expected. **Figure 14** shows the type of terrorist attack each incidence would have been, with explosions again being the most common. **Figure 15** shows the target of the attack with private institutions and businesses being most common. Finally, **Figure 16 and 17** show the nationality of the target and the country of the attack, respectively. Notably, the target of the attack and the location of the attacks did not always reflect the same country.

Figure 11: Terrorist Attacks per Year in Four Countries

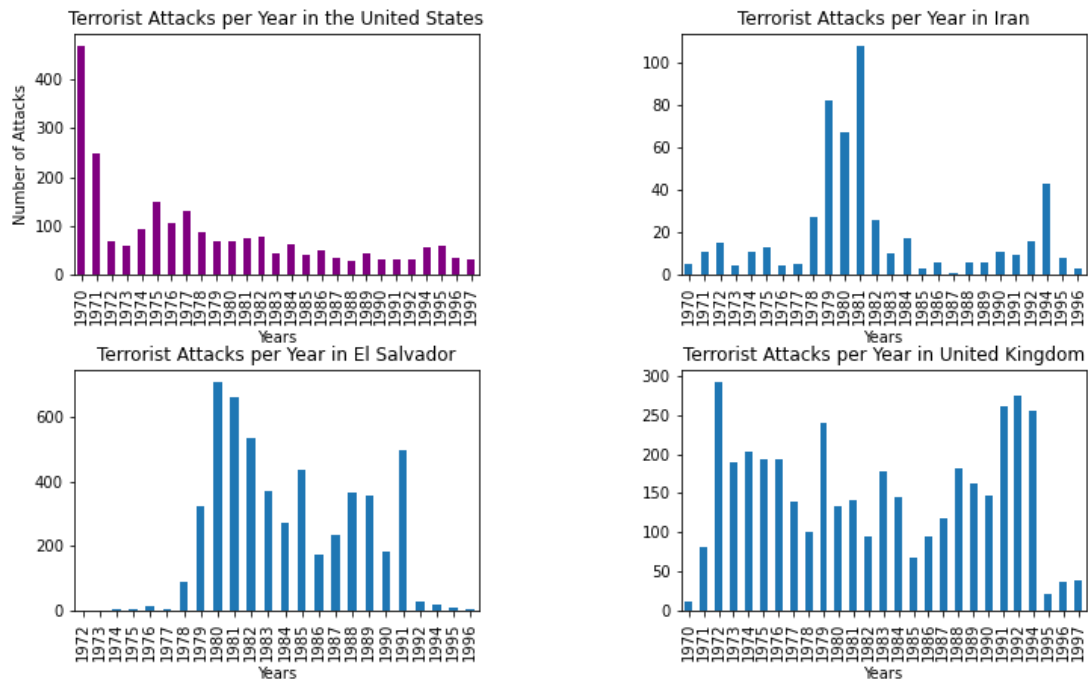

Figure 12: Was the Attack Seen as a Successful Attack?

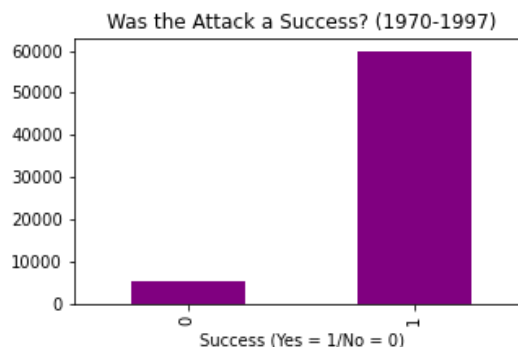

Figure 13: Primary Weapon Type in Terrorist Attacks

Figure 14: Type of Terrorist Attacks

Figure 15: Target of the Attack

Figure 16: Nationality of the Target of the Attack

Figure 17: Country of Attacks

d. Other Plots

Other plots that describe the trend of attacks can be seen below. As is seen in both the boxplot of **Figure 18** and the line graph of **Figure 19**, the number of terrorist attacks in the GTD is heightened in the early eighties through the early nineties.

Figure 18: Trend of Terrorist Attack Incidents Between 1970 and 1997.

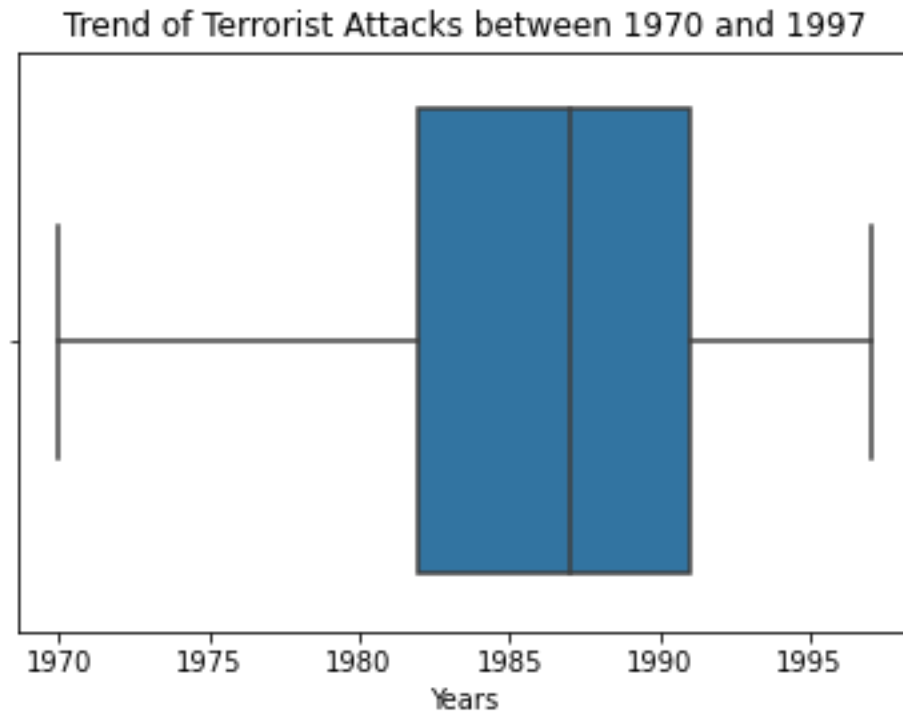

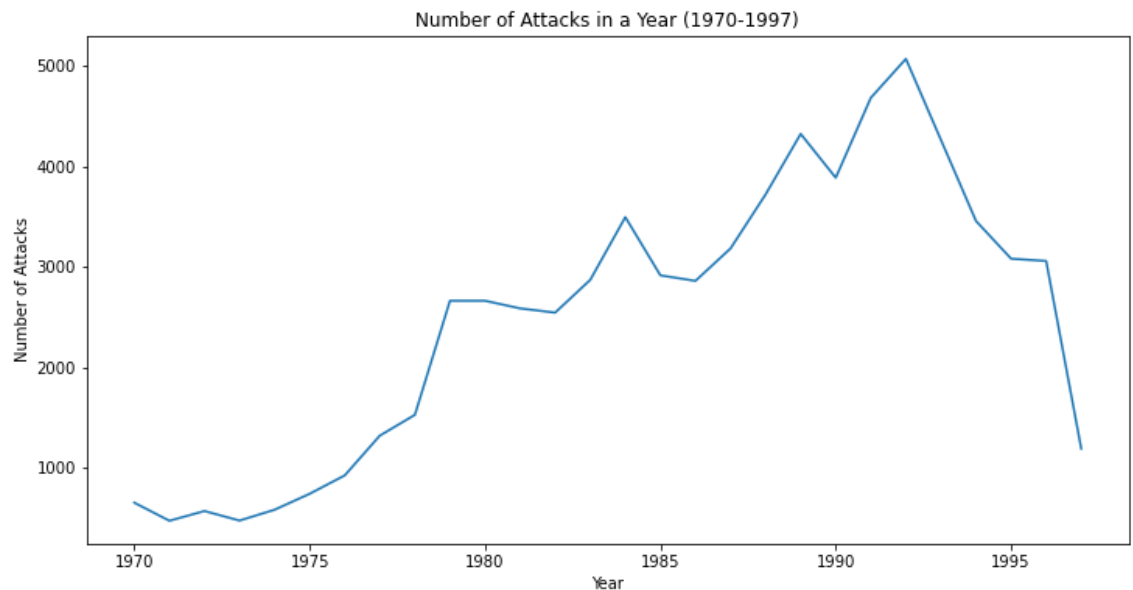

Figure 19: Number of Attacks per Year between 1970 and 1997

V. SUMMARY OF FINDINGS

Through the analysis of the Global Terrorism Database collected at the University of Maryland, several conclusions can be drawn, though important elements about global terrorism remain rather unknown. It should be noted before going further into the conclusions that many historians are skeptical of the accuracy that the GTD has for the decade of the 1970s. It should also be noted that this particular dataset stops at the 1997, though the database expands through to 2019 overall. Finally, it is important to recall that several of the variables selected in this dataset are missing, so not all conclusions drawn will be entirely accurate in the context of the historical event.

From the exploration of this data, some key details can be drawn out about the terrorist attacks occurring from 1970 through 1997. To start, we can see that the number of terrorist attacks heightened in the early 1980s and continued to increase through the 1990s, which reflects the rise in insurrections across Central America, the aftermath of the Iran Hostage Crisis, unrest across African nations, riots in India, and the formation of Al Qaeda, among various other things. Additionally, from this analysis, the primary weapon type and target type were easily found, with little of their data being absent. As should be expected, explosives and firearms were at the top of the weapons used to commit acts of terrorism. Another important thing to be noted, though seems to probably be inaccurate, is that most of the attacks between 1970 and 1997 had very few killed and very few perpetrators. This seems like it would be a miscalculation, especially in countries like in Central America where most killings result in no investigation or evidentiary searches rendering the killed in those situations unknown. Lastly, this analysis highlighted the countries which have fallen victim to terrorist attacks the most, with Peru, Colombia, El Salvador, the United Kingdom, Spain, and India all in the top six, which was slightly surprising to see for the United Kingdom and Spain. Overall, several important conclusions could be found; however, to fully understand the intricacies of terrorist attacks across the nation, more in-depth research is needed, often times for events that have been so buried that research today would be nearly impossible to do.
